- Logistic Regression

$$P(y = 1|x) = \frac{1}{1 + e^{-w^T x}}$$

- Predict 1 if $P(y = 1|x) \geq 0.5$, i.e. $w^T x \geq 0$;
- Predict 0 if $P(y = -1|x) < 0.5$, i.e. $w^T x < 0$;
- The larger $w^T x$ is, the higher our degree of "confidence" that the label is 1.
- Given a training data, we have found a good fit to the training data if we can find w so that $w^T x \gg 0$ whenever $y = 1$, and $w^T x \ll 0$ whenever $y = -1$.

Problem: How to define the confidence of a classifier without probability?

Linear Separable
Classification

Margin

Lagrange

Optimal Margin
Classifier

Soft Margin
Classification

- **Functional margin** of hyperplane (w, b) with respect to the training example $(x^{(i)}, y^{(i)})$:

$$\hat{\gamma}^{(i)} = y^{(i)}(w^T x^{(i)} + b)$$

- If $y^{(i)} = 1$, we need $w^T x^{(i)} + b$ to be a large positive number.
- If $y^{(i)} = -1$, we need $w^T x^{(i)} + b$ to be a large negative number.
- If $y^{(i)}(w^T x^{(i)} + b) > 0$, then our prediction on this example is correct.
- A large functional margin represents a confident and a correct prediction.
- Given a training set $S = \{(x^{(i)}, y^{(i)})\}_{i=1}^n$, the **functional margin** of (w, b) with respect to S :

$$\hat{\gamma} = \min_{i=1, \dots, n} \hat{\gamma}^{(i)}$$

Geometric Margin

Machine

Linear Separable
Classification

Margin

Lagrange

Optimal Margin
Classifier

Soft Margin
Classification

- Point **B** is given by $x^{(i)} - \gamma^{(i)} w / \|w\|_2$
- B lies in the decision boundary:

$$w^T (x^{(i)} - \gamma^{(i)} \frac{w}{\|w\|_2}) + b = 0$$

- Solving for **$\gamma^{(i)}$** yields:

$$\gamma^{(i)} = \frac{w^T (x^{(i)} + b)}{\|w\|_2} = \left(\frac{w}{\|w\|_2} \right)^T x^{(i)} + \frac{b}{\|w\|_2}$$

- The geometric margin of (w, b) with respect to a training example $(x^{(i)}, y^{(i)})$ is:

$$\gamma^{(i)} = y^{(i)} \left(\left(\frac{w}{\|w\|_2} \right)^T x^{(i)} + \frac{b}{\|w\|_2} \right)$$

Linear Separable
Classification

Margin

Lagrange

Optimal Margin
Classifier

Soft Margin
Classification

- Philosophy: Given a training set, a natural desideratum is to try to find a decision boundary that **maximizes** the (geometric) margin, since this would reflect a very confident set of predictions on the training set and a good “fit” to the training data.
- Assume that we are given a training set that is **linearly separable**.

$$\max_{\gamma, w, b} \gamma$$

$$s.t. \quad y^{(i)} \left(\frac{w^T}{\|w\|_2} x^{(i)} + \frac{b}{\|w\|_2} \right) \geq \gamma, i = 1, 2, \dots, n$$

- **Max Margin:** We want to maximize γ , subject to each training example having geometric margin at least γ

- **Input:** a linearly separable training set $S = \{(x^{(i)}, y^{(i)})\}_{i=1}^n$
- **Output:** a separating hyperplane and decision function
 - ① Choose parameter C and solving the following optimization problem to obtain the optimal $\alpha^* = (\alpha_1^*, \dots, \alpha_n^*)$

$$\max_{\alpha} \sum_{i=1}^n \alpha_i - \frac{1}{2} \alpha_i y^{(i)} y^{(j)} (x^{(i)})^T x^{(j)}$$

$$s.t. \quad 0 < \alpha_i \leq C, \quad i = 1, \dots, n$$

$$\sum_{i=1}^n \alpha_i y^{(i)} = 0$$

- ② Obtain the optimal (w^*, b^*) via the following equations
($0 < \alpha_J^* < C$)

$$w^* = \sum_{i=1}^n \alpha_i^* y^{(i)} x^{(i)}, \quad b^* = y^{(j)} - \sum_{i=1}^n \alpha_i^* y^{(i)} y^{(j)} (x^{(i)})^T x^{(j)}$$

- ③ Separating hyperplane: $w^* + b^* = 0$, and the decision function:
 $f_{w,b}(x) = \text{sign} \left(\sum_{i=1}^n \alpha_i^* y^{(i)} (x^{(i)})^T x + b^* \right)$

Support Vectors in Non-separable Case

- We call the training examples $(x^{(i)}, y^{(i)})$ as the support vectors, if the corresponding $\alpha_i^* > 0$.
- Recall the KKT dual complementarity condition $\alpha_i^* g_i(w^*) = 0$, and $\eta_i^* \xi_i = 0$. That is:

$$\alpha_i^* [y^{(i)}(w^{*T} x^{(i)} + b) - 1 + \xi_i] = 0, \quad \eta_i^* \xi_i = 0.$$

- If $\alpha_i^* = 0$, we have $y^{(i)}(w^{*T} x^{(i)} + b) \geq 1$. (in the correct sides)
- If $0 < \alpha_i^* < C$, we have $y^{(i)}(w^{*T} x^{(i)} + b) = 1$. (on the boundary)
- If $\alpha_i^* = C$, we have $y^{(i)}(w^{*T} x^{(i)} + b) \leq 1$. (in the wrong sides)
